West Monroe AI-Native Enterprise Agent: Senior Consultant Overview

Oct 5, 2026 · @Graham Pilkington

Bottom line

This is a lead-generation tool dressed as a research product: it turns West Monroe's annual AI report into a company-specific executive brief from one input. The concept is strong and the setup is nearly frictionless. Its weak points are thin inputs, public-only evidence, and no visible path from the brief to a decision or a conversation.

Scope: this review covers the landing page and setup form only. I did not generate a brief, so output quality is untested.

What it is

A public web agent from West Monroe's AI Enablement group that writes an AI-readiness brief for any named company.

- **Audience:** executives and the consultants selling to them.
- **Source material:** West Monroe's Building the AI-Native Enterprise report and its Enterprise AI Transformation Index.
- **Framework:** three imperatives (AI as the operating layer, bridging the AI ROI divide, rewriting the org chart) plus three shared pressures.
- **Lenses:** growth, operations, risk, workforce, customer and compliance.
- **Output:** an executive brief with a ranked 24-month AI impact view.

How it works

One input goes in, a four-part brief comes out.

1. **Find the company.** Enter a name or website. A website gives stronger evidence; a name may need confirmation.
2. **Review the match.** The tool proposes an organization and alternatives for the user to confirm.
3. **Optional industry override.** Free text, such as "utilities" or "regional bank".

4. **Generate the brief.** It opens with an executive read, then four parts:
    - Understand the company: public posture, source boundary, validation needs.
    - Read the AI pressure: which imperatives force the most change in 24 months.
    - Pressure-test implications: what changes across the six lenses.
    - Use the evidence: what leadership should validate before acting.

What works and what does not

The design is disciplined about evidence but gives the user almost no control over the result.

Strengths	Gaps
One field to start, so near-zero friction	One field also means generic output for lesser-known or private companies
Grounded in proprietary research, not a generic model answer	Public data only, so it cannot see the company's real AI maturity
Match-review step reduces wrong-company errors	No way to add role, priorities, size or known initiatives
States its source boundary and what to validate	No sample brief, so the user cannot judge value before running it
Six lenses give a consistent, comparable structure	No visible benchmark against peers, despite an index behind it
Clear "signal to decision" storyline	No stated next step after the brief: no export, share or follow-up

How it can work better

Ranked by impact for the effort. These are my recommendations, not features West Monroe has announced.

1. **Add three or four context questions.** Role, top priority, company size and current AI stage would move the brief from generic to specific.
2. **Benchmark against peers.** Score the company against the Transformation Index by industry, so the brief answers "where do we stand?"

3. **Show a sample brief up front.** A visible example sets expectations and raises completion.
4. **Label confidence on every claim.** Tag each finding as sourced, inferred or assumed, with links to the evidence.
5. **Turn findings into actions.** Add a 30/60/90-day plan with an owner and a metric for each ranked impact.
6. **Accept private inputs.** Let users upload a strategy deck or 10-K to close the public-data gap.
7. **Build the handoff.** Offer export, sharing and a booked validation session, since that is the tool's commercial purpose.
8. **Make it interactive.** Let the user question the brief and re-run a single section.
